Use of insulin like growth factor I characterised by presence of

```
The present invention relates to use of mechano-growth factor (MGF),
an Insulin-like Growth Factor-I (IGF-I) isoform in the manufacture of a
medicament for the treatment of neurological disorder. The MGF is capable
of reducing motoneurone loss by 20% or greater in response to nerve
avulsion, and effects motoneurone rescue, preferably adult motoneurone
contraction. The MGF polynucleotide and polypeptide are useful in the
contracture of a medicament for the treatment of a neurological disorder,
contracture of a medicament for the treatment of a neurological disorder,
contracture of a medicament for the treatment of a neurological disorder,
contracture of a medicament for the treatment of a neurological disorder,
contracture of a medicament for the treatment of a neurological disorder,
contracture of a medicament for the treatment of a neurological disorder,
contracture of motoneurones and/or neurodegenerative disorder,
contracture of motoneurone of juvenile muscular atrophy,
contracture of software and processive of the processive of the processive and consurances, motoneurone lesion or nerve damage, and
contracture of stabbilit IGF-I isoform MGF. MGF is a muscle
contracture of stabbilit IGF-I isoform MGF. MGF is a muscle
contracture of scalence of IGF-I exons 4, 5 and 6 in the reading frame
                    Use of mechano-growth factor, an isoform of Insulin-like Growth Factor-I, capable of reducing motoneurone loss, in the manufacture of medicament for the treatment of neurological disorder
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

mechano-growth factor; neurological disorder; neurodegenerative disorder; amyotrophic lateral sclerosis; spinal muscular atrophy; muscular atrophy; poliomyelitis; post-polio syndrome; toxin; motoneurone disorder; nerve damage; autosomal muscular dystrophy; diabetic neuropathy; sex-linked muscular dystrophy; peripheral neuropathy; Alzheimer's disease; Parkinson's disease.
                                                                                                             A use of insulin like growth factor I (IGF-1) has been developed, and is characterised by the presence of the Ec peptide, or a functional equivalent, in the treatment or therapy of a human or animal. The IGF-1 polypeptide can be used to treat muscular disorders, e.g. buchenne or Becker muscular dystrophy, autosomal dystrophies and related progressive skeletal muscle weakness and wasting, muscle atrophy in ageing humans, spinal cord injury induced muscle atrophy and neuromuscular diseases, and cardiac disorders, e.g. diseases where promotion of cardiac muscle protein synthesis is a beneficial treatment, cardiomyopathies and acute heart failure or insult, specifically myocarditis or myocardial infarction. It can also be used to promote bone fracture healing and maintenance of bone in old age. The present sequence represents rabbit IGF-1 used in the present specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Use of mechano-growth factor, an isoform of Insulin-like Growth Factor-I, capable of reducing motoneurone loss, in the manufacture of a medicament for the treatment of neurological disorder -

                                                                                                                                                                                            including a disorder of motometrones and/or neurodegenerative disorder, e.g., amyotrophic lateral sclerosis, spinal muscular atrophy, progressive spinal muscular atrophy, infantile or juvenile muscular atrophy, progressive spinal muscular atrophy, infantile or juvenile muscular atrophy, poliomyelitis or post-polio syndrome, a disorder caused by exposure to a toxin, motoneurone trauma, a motoneurone lesion or nerve damage, an injury that affects motoneurones, motoneurone loss associated with aging, peripheral neuropathies, Alzhelar dystrophy, diabetic neuropathy, peripheral neuropathies, Alzhelar dystrophy, diabetic neuropathy, peripheral neuropathies, Alzhelar isoform MGF is a muscle isoform having extracellular (EC) domain, hence also referred as IGF-I EC. The MGF protein comprises amino acid sequences encoded by nucleic acid sequence of IGF-I exons 4, 5 and 6 in the reading frame
                                                      The present invention relates to use of mechano-growth factor (MGF), an Insulin-like Growth Factor-I (IGF-I) isoform in the manufacture of a medicament for the treatment of neurological disorder. The MGF is capable of reducing motioneurone loss by 20% or greater in response to nerve avoilation, and effects motioneurone rescue, preferably adult motioneurone rescue. The MGF polynucleotide and polypeptide are useful in the manufacture of a medicament for the treatment of a neurological disorder,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1 GPETLCGAELVDALQFVCGDRGFYFNKPTGYGSSRRAPQTGIVDECCFRSCDLRRLEMY 60

The MGF is capable of reducing motioneurone loss by 20% or greater in response to nerve avulsion, and effects motioneurone rescue, preferably adult motioneurone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         mechano-growth factor; neurological disorder; neurodegenerative disorder; amyotrophic lateral sclerosis; spinal muscular atrophy; muscular atrophy; poliomyelitis; post-polio syndrome; toxin; motoneurone disorder; nerve damage; autosomal muscular dystrophy; diabetic neuropathy; sex-linked muscular dystrophy; peripheral neuropathy; Alzheimer's disease; Parkinson's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Use of mechano-growth factor, an isoform of Insulin-like Growth Factor-I, capable of reducing motoneurone loss, in the manufacture of a medicament for the treatment of neurological disorder -
           A 42 base oligonucleotide corresponding to the DNA sequence encoding amino acids 10 to 23 of mature human IGF-I was synthesized (AAN70437). The radiolabeled 42 mer was then employed to screen for IGF-I containing DNA sequences in a human liver CDNA library. Insulin-like growth factors-IA and -IB CDNAs were isolated from a human IGF-I genomic gene was isolated and mapped. It encodes at least two preproinsulin-like growth factor-I proteins. An essentially pure proproinsulin-like growth factor-I protein comprishing the sequence of amino acids shown in Figure six is claimed (AAP70277).
                                                                                                                                                                                                                                                                                                                                              49 GPETLCGAELVDALQFVCGDRGFYFNKPTGYGSSSRRAPQTGIVDECCFRSCDLRRLEMY 108

manufacture of medicament for the treatment of a neurological disorder, including a disorder of metoneurones and/or neurodegenerative disorder, including a disorder of metoneurones and/or neurodegenerative disorder, spinal muscular atrophy, progressive spinal muscular atrophy, infantile or juvenile muscular atrophy, progressive poliomyelitis or post-polio syndrome, a disorder caused by exposure to a toxin, motoneurone trauma, a motoneurone lesion or nerve damage, an injury that affects motoneurones, motoneurone lesion or nerve damage, an injury that affects motoneurones, motoneurone lesion or nerve damage, peripheral neuropathies, Alzheimer's disease and Parkinson's disease. Progressit sequence is rat IGF-I isoform MGF. MGF is a muscle isoform having extracellular (Ec) domain, hence also referred as IGF-I-Ec. The MGF protein compatises amino acid sequences encoded by an incleic acid sequence of IGF-I exons 4, 5 and 6 in the reading frame
The MGF polynucleotide and polypeptide are useful in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            of MGF.

Use of mechano-growth factor, an isoform of Insulin-like Growth Factor-I, capable of reducing motoneurone loss, in the manufacture of medicament for the treatment of neurological disorder -

Disclosure; Page 60-61; 66pp; English.

The present invention relates to use of mechano-growth factor (MGF),

ø

```
an Insulin-like Growth Factor-I (IGF-I) isoform in the manufacture of a medicament for the treatment of neurological disorder. The MGF is capable of reducing motioneurone loss by 20% or greater in response to nerve avulsion, and effects motioneuron essene, preferably adult motioneurone rescue, preferably adult motioneurone rescue. The MGF polynuclectide and polypeptide are useful in the communicature of a medicament for the treatment of a neurological disorder, including a disorder of motioneurones and/or neurodegenerative disorder, e.g., amyotrophic lateral sclerosis, spinal muscular atrophy, infantile or juvenile muscular atrophy, colimpelities or post-polio syndrome, a disorder caused by exposure to a coxin, motioneurone trauma, a motioneurone lesion or nerve damage, an injury that affects motioneurones, motioneurone loss associated with aging, autosomal or sex-linked muscular dystrophy, diabetic neuropathy, cautosomal or sex-linked muscular dystrophy, diabetic neuropathy, peripheral neuropathies, Alzheimer's disease and Parkinson's disease. The present sequence is rabbit liver-type IGF-I isoform (LIGF-I).

The IndF-I protein comprises amino acid sequences encoded by the contract of the present sequence of IGF-I exons 4 and 6.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                        Note: The present sequence (SEQ ID NO: 14) is stated as being the same as that shown in figure 10 (AAE02456) of the specification. The inversion features to modulate and memory consolidation in an animal comprises treating with an agent that modulates the activity of one or more of genes from zif268, insulin-like growth factor (IGF), curre inversion of genes from zif268, insulin-like growth factor (IGF), curre inversion of genes from zif268, insulin-like growth factor (IGF), curred to grow the computation of the method is useful for conducting a drug and/or target discovery business, which comprises conducting detail of reflicacy and toxicity in animals, and comprises conducting therapeutic profiling of the agents (or their analogues) identified, for efficacy and toxicity in animals, and comprises conducting a parameceutical preparation including one or more agents of a third party the rights for further drug development of the comprises an additional step of establishing a distribution of the current comprises an additional step of establishing a distribution of system for distributing the preparation for sale and may optionally include establishing a sales group for marketing the preparation. A pharmaceutical composition containing the agent is useful for cenhancing memory consolidation in an animal, or for augmenting learning and memory, or otherwise for enhancing the functional performance of central nervous system neurons, where the agent is a cAMP elevating agent (agents) cativates adenylate cyclase. The composition is useful for treating cativates associated with learning disabilities, memory impairment e.g. due to toxicant exposure brain injury, epilepsy, mental retardation in children and senile dementia, including Alzhelmer's disease. The
                                                                                                                                                          invention relates to modulating long term memory consolidation in
      an agent that modulates activity of one or more genes from zif268, insulin-like growth factor, glutamate receptor 2, c/EBPbeta and VGF \,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       q
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to use of mechano-growth factor (MGF),
an Insulin-like Growth Factor-I (IGF-I) isoform in the manufacture of a
medicament for the treatment of neurological disorder. The MGF is capable
of reducing motoneurone loss by 20% or greater in response to nerve
avulsion, and effects motoneurone rescue, preferably adult motoneurone
crescue. The MGF polynucleotide and polypeptide are useful in the
cmanufacture of a medicament for the treatment of a neurological disorder,
including a disorder of motoneurones and/or neurodegenerative disorder,
including a disorder of motoneurones and/or neurodegenerative disorder,
cs. 9., amyotrophic lateral sclerosis, spinal muscular atrophy,
cs. poliomyelitis or post-polio syndrome, a disorder caused by exposure to a
coliomyelitis or post-polio syndrome, a disorder caused by exposure to a
coliomyelitis or post-polio syndrome, a disorder caused by exposure to a
coliomyelitis or post-polio syndrome.

IGF-1; insulin-like growth factor I; skeletal alpha-actin gene promoter; muscle atrophy; diabetes; osteoporosis; growth disorder; therapy; AIDS; Chacot-marie-tooth disease; atherogenesis; haemophilia; neuropathy.
                                                                                                                                                                                                                                                                                                                                                     mammals. The method comprises delivering a nucleic acid vector for the expression of a growth factor or neurotrophic factor in a tissue or tissues. The present sequence represents human IGF-1 (insulin-like growth factor 1) which is used in the method of the invention. Due to the growth and stimulatory effects of growth factors and neurotrophic factors, introducing these factors to degenerated muscles in the urinary system can improve UI by enhancing both their integrity and

                                                                                                                                                                                                                                                                                                                                                                                                                                                  The amino acid sequence of the insulin-like growth factor 1 pre-protein. Processing of the protein results in a 70 amino acid mature protein. The mature protein is split into 4 domains: the B domain has strong homology to the B chain of insulin, the A domain similarly has homology to the A chain of insulin. These domains are separated by a C domain and the mature protein is terminated by a D domain at the C-terminus. The D domain sequence was used to synthesis peptides (AARB3801-2) that chains are separated by a C domain and induces include amino acid residues 60-64 of the mature IGF-1 protein. IGF-1 binds to the IGF-1 receptor (IGF-1R) via the D domain and induces activation of the IGF-1R by autophosphorylation of the IGF-1R.

The synthetic peptides are useful as inhibitors of IGF-1 binding to IGF-1R and thus may be used in the treatment of disorders characterised by many contractions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ó

                                                                                                                                                                                                                                                                     A use of insulin like growth factor I (IGF-1) has been developed, and is characterised by the presence of the Ec peptide, or a functional equivalent, in the treatment or therapy of a human or animal. The IGF-1 polypeptide can be used to treat muscular disorders, e.g. Duchenne or Becker muscular dystrophy, autosomal dystrophies and related progressive skeleral muscle weakness and wasting, muscle atrophy in ageing humans, spinal cord injury induced muscle atrophy and neuromuscular diseases, and cardiac disorders, e.g. diseases where promotion of cardiac muscle protein synthesis is a beneficial treatment, cardiomyopathies and acute heart failure or insult, specifically myocardiats or myocardial infarction. It can also be used to promote bone fracture healing and maintenance of bone in old age. The present sequence represents human IGF-1 Ea isoform used in the present specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Rabbit liver-type IGF-I isoform (L.IGF-I) protein, alternative version.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           52 GPETLCGAELVDALQEVCGDRGFYENKPTGYGSSSRRAPQTGIVDECCFRSCDLRRLEMY 111

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              g
                                                                                                                                                                                                   This sequence is the human insulin-like growth factor I (IGF-I). The DNA can be used in the vector of the invention, for expression of a nucleic acid sequence in a cell, which comprises: (a) a nucleic acid cassequence in a cell, which comprises: (a) a nucleic acid cassette containing a sequence encoding IGF-I; (b) a 5' flanking region including one or more sequences necessary for expression of the nucleic acid cassette, including a promoter from a skeletal alpha-actin gene; (c) a linker connecting the 5' flanking region to a nucleic acid, the clinker having a position for inserting the nucleic acid cassette, and lacking the coding sequence of a gene with which it is naturally associated; and (d) a 3' flanking region, including a 3' untranslated region or a 3' non coding region on both, where the 3' flanking region is 3' to the position for inserting the nucleic acid cassette and comprises a sequence from a growth hormone 3' upr. The vector can provide for efficient IGF-I expression, particularly in gene therapy. It can be used for the delivery of IGF-I for treating diseases such as muscle atrophy. C diabetes, neuropathy, esteoporosis, and growth disorders. They can be used contracting peripheral neuropathies resulting from diabetes, genetic disease such as Type I or Type II diabetes, genetic disease such as Type I or Type II diabetes, genetic disease such as Type I or Type II diabetes, genetic disease such as Type I or Type II diabetes, genetic disease such as Type I or Type II diabetes, genetic disease such as Type I or Type II diabetes, genetic disease such as Type I or Type II diabetes, genetic disease such as Type I or Type II diabetes, genetic disease such as Type I or Type II diabetes, genetic disease such as Type I or Type II diabetes, genetic disease such as Type I or Type II diabetes, genetic disease such as Type II or Type II diabetes, genetic disease such as Type II or Type II diabetes, genetic disease such as Type II or Type II diabetes, genetic disease such as Type II or Type II diabetes, genetic d
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 0;

The IGF-1 precursor is prepared by inserting the coding sequence into an
                                                                                                                                                                                                                                                                                                                        The sequence is human prepro-somatomedin-C. DNA probes prepared against DNA encoding the protein sequence may be used to detect the presence of the genes in a natural source. The probes may be used to detect mutations and/or deletions in humans suffering from growth deficiencies.

                                                                                                                                                                                                                                                                             an Insulin-like Growth Factor I (IGF-I) isoform in the manufacture of a medicament for the treatment of neurological disorder. The MGF is capable of reducing motoneurone loss by 20% or greater in response to nerve avulsion, and effects motoneurone rescue, preferably adult motoneurone rescue. The MGF polynucleotide and polypeptide are useful in the manufacture of a medicament for the treatment of a neurological disorder including a disorder of motoneurones and/or neurodegenerative disorder, e.g., amyorrophic lateral sclerosis, spinal muscular atrophy, progressive spinal muscular atrophy, infantile or juvenile muscular atrophy, progressive poliomyelitis or post-polio syndrome, a disorder caused by exposure to a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           toxin, motoneurone trauma, a motoneurone lesion or nerve damage, an injury that affects motoneurones, motoneurone lesion or nerve damage, an injury that affects motoneurones, motoneurone loss associated with aging, autosomal or sex-linked muscular dystrophy, diabetic neuropathy, peripheral neuropathies, Alzheimer's disease and Parkinson's disease. The present sequence is alternative version of rabbit liver-type IGF-I isoform (L.IGF-I). The L.IGF-I protein comprises amino acid sequences encoded by nucleic acid sequence of IGF-I exons 4 and 6.

Note: The present sequence is stated as being the same as SEQ ID NO:14 shown in sequence listing (AAE02452) of the specification. However
                                                                                                                                                     Ø
                                                                                                                            Use of mechano-growth factor, an isoform of Insulin-like Growth Factor-I, capable of reducing motoneurone loss, in the manufacture of medicament for the treatment of neurological disorder
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        9

Patent No. 6150168
GENERAL INFORMATION:
APPLICANT: Woo, Savio L.C.
APPLICANT: Smith, Louis C.
APPLICANT: Cristiano, Richard J.
APPLICANT: Gritchalk, Stephen
TITLE OF INVENTION: MCLEIC ACID TRANSPORTER SYSTEMS AND TITLE OF INVENTION: METHODS OF USE
NUMBER OF SEQUENCES: 65
CORRESPONDENCE ADDRESS:
                                      COMPUTER READBLE FORM:
MEDIUM TYPE: 3.5" Diskette, 1.44 Mb
MEDIUM TYPE: storage
COMPUTER: IBM Compatible
OPERATING SYSTEM: IBM P.C. DOS 5.0
SOFTWARE: FastSEQ for Windows 2.0
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/167,641C
FILING DATE: December 14, 1993
CLASSIFICATION DATA:
PRICK CATION NUMBER: 07/855,389
FILING DATE: March 20, 1992
APPLICATION NUMBER: PCT/US93/02725
FILING DATE: March 19, 1993
ATTORNEY AGENT INFORMATION:
NAME: Warburg, Richard J.
REGISTRATION NUMBER: 205/012
REDECOMMUNICATION INFORMATION:
TELECOMMUNICATION NUMBER: 205/012
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                COMPUTER READABLE FORM:

Submitted (SEP-1997) to the EMBL/GenBank/DDBJ databases.
-- FUNCTION: THE INSULIN-LIKE GROWTH FACTORS, ISOLATED FROM PLASMA,
-- ARE STRUCTURALLY AND FUNCTIONALLY RELATED TO INSULIN BUT HAVE A
MUCH HIGHER GROWTH-PROMOTING ACTIVITY.
-- SUBCELLULAR LOCATION: Secreted.
-- ALTERNATIVE PRODUCTS: 2 ISOFORMS; IGF-IA AND IGF-IB (SHOWN HERE);
-- ALTERNATIVE PRODUCTS: 2 ISOFORMS; IGF-IA AND IGF-IB (SHOWN HERE);
-- SIMILARITY: BELONGS TO THE INSULIN/IGF/RELAXIN FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            PROSITE; PS00262, INSULIN; 1.

Riccation of disulphide bonds in human insulin-like growth factors
[IGFs] synthesized by recombinant DNA technology.";
Biomed. Environ. Mass Spectrom. 16:3-8(1988).
-!- FUNCTION: THE INSULIN-LIKE GROWTH PROTORIX RELATED TO INSULIN BUT HAVE A
MUCH HIGHER GROWTH-PROMOTING ACTIVITY.
-!- SUBCELLUIAR LOCATION: Secreted.
-!- SUBCELLUIAR LOCATION: Secreted.
-!- ALTERNATIVE PRODUCTS: TWO FORMS OF IGF-1, IGF-IA AND IGF-IB ARE
PRODUCED BY ALTERNATIVE SPLICING.
-!- SIMILARITY: BELONGS TO THE INSULIN/IGF/RELAXIN FAMILY.
                                                                                                                                                                                                                                                                                                                                                                Sato A., Nishimura S., Ohkubo T., Kyogoku Y., Koyama S., Kobayashi M., Yasuda T., Kobayashi Y.;

Roschdorf G. Gisulphide bonds in human insulin-like growth factors

(IGFs) synthesized by recombinant DNA technology.";

Biomed. Environ. Mass Spectrom. 16:3-8(1988).

I- FUNCTION. THE INSULIN-LIKE GROWTH FACTORS, ISOLATED FROM PLASMA,

ARE STRUCTURALLY AND FUNCTIONALLY RELATED TO INSULIN BUT HAVE A

MUCH HIGHER GROWTH-PROMOTING ACTIVITY.

I- SUBCELLULAR LOCATION: Secreted.

I- ALTERNATIVE PRODUCTS: TWO FORMS OF IGF-1, IGF-IA AND IGF-IB ARE

PRODUCED BY ALTERNATIVE SPLICING.

I- SIMILARITY: BELONGS TO THE INSULINIGFRELAXIN FAMILY.

-!- FUNCTION: THE INSULIN-LIKE GROWTH FACTORS, ISOLATED FROM PLASMA, ARE STRUCTURALLY AND FUNCTIONALLY RELATED TO INSULIN BUT HAVE A MUCH HIGHER GROWTH-PROMOTING ACTIVITY.
-!- SUBCELLULAR LOCATION: Secreted.
-!- ALTERNATIVE PRODUCTS: 3 ISOFORMS, A, B (SHOWN HERE) AND C; ARE PRODUCED BY ALTERNATIVE SPLICING.
-!- SIMILARITY: BELONGS TO THE INSULIN/IGF/RELAXIN FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A.

Comp. Endocrinol. 79:459-468(1990).
-!- FUNCTION: THE INSULIN-LIKE GROWTH FACTORS, ISOLATED FROM PLASMA,
ARE STRUCTURALLY AND FUNCTIONALLY RELATED TO INSULIN BUT HAVE A
MUCH HIGHER GROWTH-PROMOTING ACTIVITY.
                                                                                                                                                                                                                                                                                                                                                            "Structure of the chicken insulin-like growth factor I gene reveals conserved promoter elements.";
J. Biol. Chem. 266:9724-9731(1991).

Kato H., Okoshi A., Miura Y., Noguchi T.;
"A new cDNA clone relating to larger molecular species of rat insulin-
like growth factor-I mRNA.";
Agric. Biol. Chem. 54-1599-1601(1990).
-: SUBCELLOLAR LOCATION: SECRETED (BY SIMILARITY).
-: SIMILARITY: BELONGS TO THE INSULIN/IGF/RELAXIN FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Rattus sp.

DNA CELL BIOL. 13:555-559(1994).

-!- FUNCTION: THE INSULIN-LIKE GROWTH FACTORS, ISOLATED FROM ARE STRUCTURALLY AND FUNCTIONALLY RELATED TO INSULIN BUT WUCH HIGHER GROWTH-PROMOTING ACTIVITY.

-!- SUBCELLULAR LOCATION: SECREFED.

-!- SUBLILARITY: BELONGS TO THE INSULIN/IGF/RELAXIN FAMILY.
